SHA-256: d7c49ca59111b13ec4a86cf37340fb310e22b1c2b1fffb367daf2fa01dc99123c

Portable Windows tool for batch conversion of Word, Excel, and PowerPoint documents through native Microsoft Office export, plus common processing of ready PDFs.

Features

- recursive folder conversion with mirrored output structure;
- direct conversion of one Office file;
- 16:9 or A-series post-crop for presentation exports;
- presentation content scaling;
- PDF splitting, aspect/margin cropping, numbering, and content scaling;
- metadata under `report\latest\metadata` and run archives;
- shared Source/Target routes across GUI and CLI.
- Word: `.doc`, `.docx`, `.docm`, `.rtf`, `.txt`, `.odt`
- Excel: `.xls`, `.xlsx`, `.xlsm`, `.xlsb`, `.csv`, `.ods`

- PowerPoint: `.ppt`, `.pptx`, `.pptm`, `.odp`

GUI

Run `launcher_gui.cmd`. The canonical Workbench I/O at the upper left defines direct routes:

- `Source` is a folder or one Office/PDF file;
- `Target` is the result folder;
- source data is not copied into staging or a cache;
- `input` and `output` remain safe initial values and CLI defaults.

Path history is local and excluded from Git. Pinning, locking, file/folder selection, list view, reset, and guarded deletion match the other Audion Workbench projects.

See `docs\GUI.md` for the full GUI guide.

CLI

Convert default `input` to `output`:

```
python system_core\main.py batch --recursive --extensions docx,pptx,xlsx
```

Convert custom folders:

```
python system_core\main.py batch --recursive --input-dir "D:\DOCS" --output-dir "E:\PDF" --extensions docx,pptx,xlsx
```

Convert one file:

```
python system_core\main.py file --input "D:\DOCS\report.docx" --output-dir "E:\PDF"
```

Process one PDF or a folder of PDFs through explicit routes:

```
python system_core\main.py pdf-crop-aspect --mode "16:9" --input-dir "D:\PDF\source.pdf" --output-dir "E:\PDF"
python system_core\main.py pdf-scale-content --percent 98 --input-dir "D:\PDF" --output-dir "E:\PDF"
```

Omitting `--input-dir/--output-dir` preserves the legacy `input -> output` behavior.

Working data

- `input`, `output`: default routes;
- `report`: metadata and run archives;
- `logs`: CLI and GUI logs;
- `config`: manifest, themes, and settings.

`cleanup_project.cmd` removes only the generated/runtime content declared by that script.

Distribution checks include `install\Check-CmdEncoding.cmd` and smoke/doctor commands.

Requirements

- Windows;
- installed Microsoft Office desktop applications;
- the project portable runtime or compatible Python;
- `pypdf`, `nicegui`, `pyyaml`, `rich`, `pywebview`.

Primary files: `launcher_gui.cmd`, `system_core\main.py`, `system_core\office_export.ps1`,
`system_core\ui_nicegui\app.py`, `system_core\ui_nicegui\workbench.py`,
`config\tool_manifest.yaml`.
